FLIF - Free Lossless Image Format

FLIF is a novel lossless image format which outperforms PNG, lossless WebP, lossless BPG, lossless JPEG2000, and lossless JPEG XR in terms of compression ratio.

According to the [compression experiments we have performed \[older results here\]](#), FLIF files are on average:

- 14% smaller than lossless [WebP](#),
- 22% smaller than lossless [BPG](#),
- 33% smaller than brute-force crushed PNG files (using ZopfliPNG),
- 43% smaller than typical PNG files,
- 46% smaller than optimized Adam7-interlaced PNG files,
- 53% smaller than lossless JPEG 2000 compression,
- 74% smaller than lossless JPEG XR compression.

Even if the best image format was picked out of PNG, JPEG 2000, WebP or BPG for a given image corpus, depending on the type of images (photograph, line art, 8 bit or higher bit depth, etc), **then FLIF still beats that by 12%** on a median corpus (or 19% on average, including 16-bit images which are not supported by WebP and BPG).

BPG Web Encoder

BPG Web Encoder provides online transcoding of traditional jpg/png image to superior bpg files. The original libbpg encoder version is used to transcode the images with the default encoder options.

Captcha: The captcha has 3 mn validity.

+ Add files... **⊕ Start upload** **⊖ Cancel upload** **⚙ Encoding options**

Notes

- **News :** usage of libbpg **0.9.6** and bpg encoding options.
- The maximum file size for uploads is **6 MB**.
- The maximum file count per captcha identification is **10**.
- Only image files (**JPG, PNG**) are allowed.
- Encoded and uploaded files will be deleted automatically **10 minutes** after the encoding end.
- 3 minutes encoding timeout. It may be an issue with image data close to the maximum allowed size.
- The application is hosted in a one core cpu openstack container. The encoding time is therefore **SLOW**.
- The encoding time on a multicore modern CPU PC is dramatically **FASTER**.

Overview of JPEG XT

JPEG XT (ISO/IEC 18477) specifies a series of backwards compatible extensions to the legacy JPEG standard (ITU Recommendation T.81 | ISO/IEC 10918-1).

While JPEG is still the dominant technology for storing digital images, it fails to address several requirements that have become important in recent years, such as compression of images with higher bit depths (9 to 16 bits), high-dynamic-range imaging, lossless compression, and representation of alpha channels.

JPEG XT extends the JPEG specification in a completely backwards compatible way. Existing tools and software will continue to work with the new code streams, while new features will help move JPEG into the 21st century.

JPEG XT, like most other JPEG standards, is a multi part specification. The following parts are currently in the process of standardization:

Part 1, Core coding system

JPEG XT Part 1 specifies the base technology, and specifies as such the core JPEG as it is used nowadays, namely as a selection of features from ISO/IEC 10918-1, 10918-5 and 10918-6. Part 1 defines as what is commonly understood as JPEG today.

Part 2, Coding of high dynamic range images

JPEG XT Part 2 is a backwards compatible extension of JPEG towards high-dynamic range photography using a legacy text-based encoding technology for its metadata.

Part 3, Box file format

JPEG XT Part 3 specifies an extensible boxed-based file format all following and future extensions of JPEG will be based on. The format specified in Part 3 is itself compatible to JFIF, ISO/IEC 10918-5, and thus can be read by all existing implementations.

ZorroSVG - Put a Mask on it

The transparency of PNGs for the file size of JPEGs

Try it

Drag a transparent PNG or GIF from your desktop onto this page or use the file picker and see how many kB ZorroSVG can save you.

No file selected.

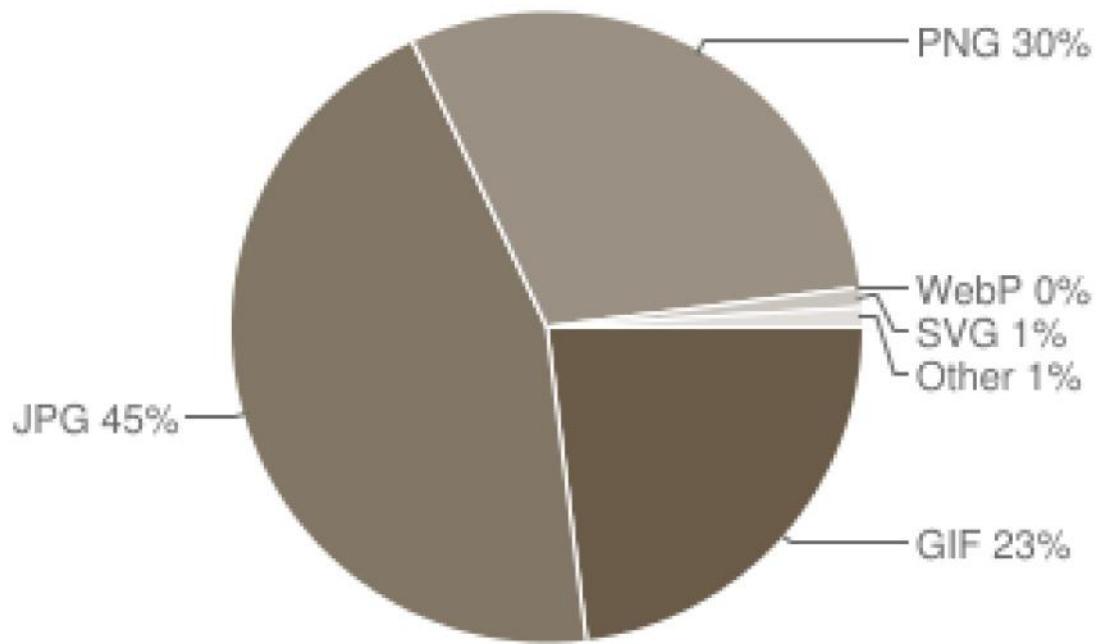

ZorroSVG

Transparent PNGs are great, but they come at a price: file size. Wouldn't it be nice if there were transparent JPEGs instead? Unfortunately there is no such thing, but ZorroSVG gives you the power of transparent PNGs for the size of a JPEG.

It achieves this by converting your PNG to an SVG which uses the compositing capabilities of SVG to create a masked bitmap on-the-fly using JPEGs for both the image and its mask - achieving most of the time a much better compression than PNG. Since all the compositing and masking happens inside the SVG there is no JavaScript required. **And it will work**

PageSpeed Module

PageSpeed speeds up your site and reduces page load time. This open-source webserver module automatically applies [web performance best practices](#) to pages and associated assets (CSS, JavaScript, images) without requiring that you modify your existing content or workflow.

Features

- Automatic website and asset optimization
- Latest web optimization techniques
- 40+ configurable optimization filters
- Free, open-source, and frequently updated
- Deployed by individual sites, hosting providers, CDNs

Get Started

- Download and install
- Review documentation
- Frequently asked questions
- Discuss PageSpeed for Apache and Nginx
- Subscribe to PageSpeed announcements for [Apache](#) and [Nginx](#)
- Learn about performance best practices

RESPONSIVE IMAGES COMMUNITY GROUP

We're a group of developers working towards a markup-based means of delivering alternate image sources based on device capabilities to prevent wasted bandwidth and optimize display for both screen and print.

JOIN US!

Examples of [art direction](#). See more [demos of responsive images](#).

WHAT IS THE `PICTURE` ELEMENT?

The picture element is a markup pattern that allows developers to declare multiple sources for an image. By using media queries, it gives developers control as to when and if those images are presented to the user.

SAMPLE MARKUP FOR `PICTURE`

```
<picture>
  <source media="(min-width: 40em)" srcset="big.jpg 1x,
  big-hd.jpg 2x">
  <source srcset="small.jpg 1x, small-hd.jpg 2x">
  
```

WHAT IS THE `SRCSET` ATTRIBUTE?

The srcset attribute is an extension to the existing img tag that provides some of the functionality of the picture element. It uses a more concise syntax, part of which can be used by the picture element.

SAMPLE MARKUP FOR `SRCSET`

```

```

[Read the srcset Specification](#)

[Example srcset parser](#)

HTML5 srcset

```

```

HTML5 srcset

```
  
  

```

HTML5 picture

```
<picture>  
  <source srcset="S.jpg" media="(max-width: 600px)">  
  <source srcset="L.jpg" media="(min-width: 1200px)">  
    
</picture>
```

Leaner Responsive Images With Client Hints

By Jon Arne Sæterås

January 18th, 2016

24 Comments

Responsive images have been around long enough for most of us to have taken them for a spin, or at least to have learned from the experiences of those who have. Beyond doubt, the responsive images specification is a great win for the web. However, quite a few reports from the front lines suggest that responsive images **can become pretty ugly**.

The good news is that there is a fix! No, not throwing JavaScript

at the challenge, but by asking the web server for a helping

hand. Enter Client Hints, an initiative spearheaded by Google

The technology behind preview photos

Brian K Cabral

Edward Kandrot

First impressions matter, whether you're on a first date, in a job interview, or just choosing new decorations for your house. Some of the first things you see when you visit someone's profile or page on Facebook are the pictures. These pictures are an integral part of the Facebook experience, but sometimes they can be slow to download and display. This is especially true on low-connectivity or mobile networks, which often leave you staring at an empty gray box as you wait for images to download. This is a problem in developing markets such as India, where many people new to Facebook are primarily using 2G networks. Our engineering team took this on as a challenge. What
