PHP 5.3.0 Release Announcement

The PHP development team is proud to announce the immediate release of PHP 5.3.0. This release is a major improvement in the 5.X series, which includes a large number of new features and bug fixes.

The key features of PHP 5.3.0 include:

- Support for [namespaces](#)
- [Late static binding](#)
- [Lambda Functions and Closures](#)
- Syntax additions: [NOWDOC](#), [ternary short cut "?:"](#) and [jump label](#) (limited goto), [__callStatic\(\)](#)
- Under the hood performance improvements 
- Optional [garbage collection](#) for cyclic references
- Optional [mysqlnd](#) PHP native replacement for libmysql 
- Improved [Windows](#) support including VC9 and experimental X64 binaries as well as portability to other supported platforms
- More consistent float rounding
- Deprecation notices are now handled via `E_DEPRECATED` (part of `E_ALL`) instead of the `E_STRICT` error level
- Several enhancements to enable more [flexibility in php.ini](#) (and ini parsing in general)
- New bundled extensions: [ext/phar](#), [ext/intl](#), [ext/fileinfo](#), [ext/sqlite3](#), [ext/enchant](#)
- Over 140 bug fixes and improvements to PHP, in particular to: [ext/openssl](#), [ext/spl](#) and [ext/date](#)

This release also drops several extensions and unifies the usage of internal APIs. Users should be aware of the following known backwards compatibility breaks:

- Parameter parsing API unification will cause some functions to behave more or less strict when it comes to type juggling
- Removed the following extensions: [ext/mhash](#) (see [ext/hash](#)), [ext/msql](#), [ext/pspell](#) (see [ext/enchant](#)), [ext/sybase](#) (see [ext/sybase_ct](#))
- Moved the following extensions to PECL: [ext/ming](#), [ext/fbsql](#), [ext/ncurses](#), [ext/fdf](#)
- Removed [zend.ze1 compatibility mode](#)

For users upgrading from PHP 5.2 there is a migration guide available [here](#), detailing the changes between those releases and PHP 5.3.0.

For a full list of changes in PHP 5.3.0, see the [ChangeLog](#).

- Fixed a possible memory corruption in substr_replace().
- Fixed a possible memory corruption in addslashes().
- Fixed a possible stack exhaustion inside fnmatch().
- Fixed a possible dechunking filter buffer overflow.
- Fixed a possible arbitrary memory access inside sqlite extension.
- Fixed string format validation inside phar extension.
- Fixed handling of session variable serialization on certain prefix characters.
- Fixed a NULL pointer dereference when processing invalid XML-RPC requests (Fixes CVE-2010-0397, bug #51288).
- Fixed SplObjectStorage unserialization problems (CVE-2010-2225).
- Fixed possible buffer overflows in mysqlnd_list_fields, mysqlnd_change_user.
- Fixed possible buffer overflows when handling error packets in mysqlnd.

Key enhancements in PHP 5.3.3 include:

- Upgraded bundled sqlite to version 3.6.23.1.
- Upgraded bundled PCRE to version 8.02.
- Added FastCGI Process Manager (FPM) SAPI. 
- Added stream filter support to mcrypt extension.
- Added full_special_chars filter to ext/filter.
- Fixed a possible crash because of recursive GC invocation.
- Fixed bug #52238 (Crash when an Exception occurred in iterator_to_array).
- Fixed bug #52041 (Memory leak when writing on uninitialized variable returned from function).
- Fixed bug #52060 (Memory leak when passing a closure to method_exists()).
- Fixed bug #52001 (Memory allocation problems after using variable variables).
- Fixed bug #51723 (Content-length header is limited to 32bit integer with Apache2 on Windows).
- Fixed bug #48930 (__COMPILER_HALT_OFFSET__ incorrect in PHP >= 5.3).

For users upgrading from PHP 5.2 there is a migration guide available on <http://php.net/migration53>, detailing the changes between those releases and PHP 5.3.

For a full list of changes in PHP 5.3.3, see the [ChangeLog](#).

Distributions: Please Don't Cripple PHP or Red Hat: Stop Fucking Around

Barcelona, Spain

Wednesday, February 4th 2009, 16:40 CET

A friend of me pointed me to an issue in the Agavi issue tracker titled "["Fucking Debian fucking ruined their fucking PHP package once again, and now we need to waste fucking time to fucking fix it"](#)". The issue is quite related to earlier discussions with the Red Hat folks about bundling a timezone database with PHP. Red Hat thought it'd be wise to create a patch to use the system provided timezone database instead. We (the PHP development team) thought that to be a bad idea because of several reasons. Among them is that it removes control from PHP's users about which database is, decreased performance, and some missing functionality. On top of that I [mentioned](#) that although the bundled timezone database is a concatenation of the system provided timezone database files, that might not necessarily be like that in the future. PHP does of course support means of upgrading the timezone database. For every release of the [Olson](#) database, there is now a bundled timezone database available through [PECL](#).

Because of these reasons, we didn't want to accept Red Hat's patch to disable the bundled timezone database. The most *important* thing however for users of PHP that *PHP works the same on every system*. We, the PHP developers, see this as a much more important thing as a tiny bit of annoyance by distributions' maintainers to have to package the timezone database for PHP separately. Unfortunately the Red Hat PHP package maintainer proceeded to deploy this patch in RHEL and Fedora. SuSE, Debian and Ubuntu have since then picked up on it as well. So instead the Agavi issue's title should be "*Fucking Red Hat fucking ruined their fucking PHP package and every other distribution once again, and now we need to waste fucking time to fucking fix it*". Unfortunately, this is not where it stops.

But first we go back on how PHP determines which timezone to use and what a timezone is. For PHP, a

Life Line

Fixed the Alice House and added other buildings/house numbers in that block.

Kompatibilität / Features

Du musst zum Beispiel:

- eine alte PHP Version unterstützen
- mehrere PHP Versionen bzw.

PHP irgendwer?

Konfigurationen testen

- proprietäre Extensions nutzen die nur mit bestimmten PHP Versionen funktionieren
- die letzte Entwickler-Version testen (trunk)

```
./configure  
make  
sudo make install
```

<http://www.php.net/downloads.php>

```
./configure  
make  
make test  
sudo make install
```

Linux
Unix
Mac OS X
Windows

-> benutze einfach die binaries
oder wenn man wirklich muss; besuche:
<http://wiki.php.net/internals/windows/stepbystepbuild>

\ = escape linebreaks

```
sudo apt-get install \
automake autoconf gcc \
libtool binutils subversion \
libxml2-dev libcurl4-dev \
libfreetype6-dev libjpeg-dev libpng-dev
```

packages fuer debian / ubuntu

./configure --help

Usage: configure [options] [host]

Options: [defaults in brackets after descriptions]

Configuration:

--cache-file=FILE	cache test results in FILE
--help	print this message
--no-create	do not create output files
--quiet, --silent	do not print `checking...' messages
--version	print the version of autoconf that created con
Directory and file names:	
--prefix=PREFIX	install architecture-independent files in PREF [/usr/local]
--exec-prefix=EPREFIX	install architecture-dependent files in EPREFI [same as prefix]
--bindir=DIR	user executables in DIR [EPREFIX/bin]
--sbindir=DIR	system admin executables in DIR [EPREFIX/sbin]

Standard aktivierte Extensions

(in PHP 5.3)

Core	ctype	date
dom	ereg	fileinfo
filter	hash	IIconv
json	libxml	pcre
PDO	pdo_sqlite	Phar
posix	Reflection	session
SimpleXML	SPL	SQLite
sqlite3	standard	tokenizer
xml	xmlreader	xmlwriter

`./configure --disable-simplexml --without-sqlite3`

Populäre PHP Extensions

- APC, xCache, eAccelerator
- Memcache, memcached
- Xdebug
- PostgreSQL, mongoDB, OCI8, SQLSRV
- Sphinx, xapian, mnogosearch, solr
- Suhosin

PECL

```
sudo pecl install apc
```

<http://pecl.php.net/>

Extensions kompilieren

```
phpize  
./configure  
make  
sudo make install
```

phpize gibt es ab php 5.3.6 auch fuer windows

/usr/local/lib/php.ini

[apc]

extension=apc.so

[xdebug]

zend_extension="/usr/local/lib/php
/extensions/no-debug-non-zts-
20090626/xdebug.so"
